

Stock Trading Game

Description

As a day trader, your goal is not just to trade, but to outperform the market, a challenge that keeps the game exciting and engaging.

Imagine you have \$100 as your initial investment and are interested in trading with only one stock (let's say, Gamelytics).

Incidentally, the stock is currently at \$100 at the beginning of the trading day, which means you can buy exactly one stock on the first day.

Assume that:

1. You don't want to invest in any other stock.
2. You either invest all your money (i.e., 100%) or not invest anything (i.e., 0%). You don't want to invest partially.

With a simple and straightforward trading strategy, you decide to buy, sell, or hold at the beginning of the day, and then let the market do its thing until the next day begins.

Each day, you'll use the 'Buy' and 'Sell' buttons to decide whether to maintain your investment in the stock. Once you've made your decision (buy, sell, or hold), click the 'Next Day' button to see how your decision affected that day's performance.

The game lasts thirty (30) days. If your account balance is positive, you have beaten the market. If it's negative, you didn't.

Remember, your final score is the difference between your account balance and the stock price. Your goal is not just to beat the market, but to maximize your score, so stay focused and make every decision count.
